Experiment: Mobile Application Wireframe for Ad Hoc Wireless Networks

Aim

To design a mobile application wireframe using Figma to address challenges in ad hoc wireless networks, including device discovery, network connectivity, routing, signal monitoring and security.

Procedure

1. Open Figma and create a new design file.
2. Create a mobile frame with dimensions of 390 × 844 pixels.
3. Design a login screen with username, password and login button.
4. Create a dashboard displaying network status, active devices and signal strength.
5. Design a device discovery screen to scan and connect nearby devices.
6. Create a network topology screen showing connected nodes and wireless links.
7. Design a routing management screen to display source, destination and communication paths.
8. Add a monitoring screen displaying signal strength, packet loss and network latency.
9. Create an alerts screen to display connection failures and security notifications.
10. Add bottom navigation and connect all screens using Figma Prototype mode.
11. Preview the application and verify the navigation between screens.
